Introduction

The TAILOR network includes many of Europe's top AI labs. However, we also want to reach out to the many other excellent labs and organisations across Europe to work together and create new breakthroughs in AI. The Connectivity Fund is a key instrument in this mission.

To establish a truly vibrant network, the Connectivity Fund provides funding to Al researchers from across Europe for research visits or workshops that bring together researchers from TAILOR labs and non-TAILOR labs. It especially aims to support young researchers to gain valuable experience and nurture the next generation of Al researchers. The goals, scope, organisation, proposal evaluation, and legal framework have all been described in earlier deliverables D10.1-10.6. This series of deliverables provided updates on the status of the connectivity fund. They detailed the number of submissions, the evaluation process, and the outcomes, funded visits, and workshops in a transparent way.

Since this is the final report, it will summarise the results of the entire open call, from its opening until the final submission date on April 30th, 2024. The last call required that all visits be completed before the end of the TAILOR programme. Hence, this deliverable covers the period between 15th of March 2021 and the 31st of August 2024. In the remainder of this document, we will detail all received proposals, their evaluation outcome, dissemination activities and any organisational changes in the last reporting period (after 15th of July, 2023).

Overview

The connectivity fund has funded 67 research visits between TAILOR and non-TAILOR labs, 18 workshops, and 3 micro-projects with industry, hence 87 grants were funded in total. We received and evaluated 108 proposals, 12 were rejected, 2 retracted, and 7 were canceled after acceptance by the recipient because of unforeseen circumstances or inability to sign the subgrant agreement.

A geographical overview is shown below, showing how the connectivity fund has expanded research from the original TAILOR labs (in blue) to many other labs (in pink), and has realised workshops (in green) and micro-projects (in yellow) all over Europe. As such, it has spread knowledge from the TAILOR labs to many other parts of Europe, and vice versa.

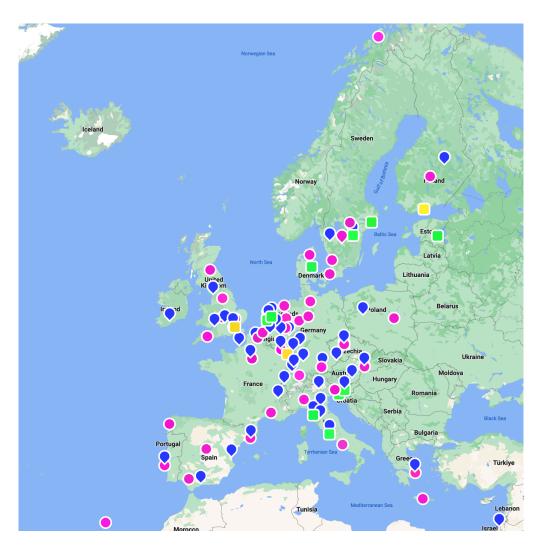

Figure 1. Geographical overview of Connectivity Fund visits, with all TAILOR labs in blue, the Connectivity Fund beneficiaries (non-TAILOR labs) in pink, workshops in green, and micro-projects in yellow. Note that visits, workshops and labs within the same city can overlap.

Figure 2. A zoomed-in overview focussing on western Europe, to discern labs situated more closely together.

Dissemination activities

Throughout the TAILOR project, we have widely announced the Connectivity Fund calls and put a spotlight on successful activities to make sure that it is widely known in the European AI community.

Connectivity Fund Website

https://tailor-network.eu/connectivity-fund/

The Connectivity Fund website, seamlessly integrated in the TAILOR project website, has all the latest information about the aims of the fund, how to apply, the evaluation procedure, and other useful information for applicants. It was repeatedly updated to streamline the application process. It also contains a gallery of all funded projects to inspire would-be applicants. Figures 3 and 4 show screenshots of the cover page and a very small part of the project gallery of successful research visits and workshops.

Connecting all of Europe's top Al labs

The TAILOR network includes many of Europe's top AI lab, and we want to reach out to the many other excellent labs and organizations across Europe to work together and create new breakthroughs in AI.

We especially aim to support young researchers to gain valuable experience and nurture the next generation of AI researchers.

Fostering Appropriate Trust in Predictive Policing Al System: 22 May 2023

Siddharth Mehrotra PhD student at TU Delft The use of AI in law enforcement, particularly in predictive policing, raises

concerns about bias, discrimination, and infringement of civil liberties. Building appropriate trust in these systems is crucial to address these concerns and ensure ethical use. In this research proposal, we aim to investigate how explanations generated... Read more

Meta-learning for Continual 22 May 2023

Anna Vettoruzzo PhD student at the Halmstad University Continual learning (CL) refers to the ability to continually learn over time by

accommodating new knowledge while retaining previously learned experiences. While this concept is inherent in the human learning ability, current machine learning-based methods struggle with this as they are highly prone to forget past experiences... Read more

predictive monitoring under LTLf

Efrén Rama Maneiro PhD student at the University of Santiago de Compostela Predictive monitoring

is a subfield of process mining that focuses on predicting how a process will unfold. Deep learning techniques have become popular in this field due to their enhanced performance with respect to classic machine learning models. However, most of these approaches... Read more

Data-Centric AutoML and Benchmarks with Optimal 22 May 2023

Prabhant Singh Research Engineer at TU Eindhoven Automated machine learning (AutoML) aims

to make easier and more accessible use of machine learning algorithms for researchers with varying levels of expertise. However, AutoML systems, including classical ones such as Auto-Sklearn and Neural Architecture Search (NSGANet, ENAS, DARTS), still face challenges with starting from scratch for their... Read more

Multi-Objective Rating Systems

Paolo Turrini Associate Professor at the Department of Computer Science, University of Warwick This project studies rating systems with multiple objectives,

where users are matched to items in order to satisfy several desirable properties. In particular, it looks beyond classical Pareto efficiency, modelling and studying allocations that satisfy fairness, diversity and reliability. This project will..

Optimal training of a structured ensemble of Binarized Neural Networks with Mixed-Integer Linear Programming techniques

Simone Milanesi, Ambrogio Maria Bernardelli PhD students at the

CompOpt Lab (University of Pavia) Binarized Neural Networks (BNNs) are receiving increasing attention due to their lightweight architecture and ability to run on low-power devices. The Mixed-Integer Linear Programming (MILP) approach achieves the state of the art for training classification BNNs when limited data are available.We propose... Read more

June 12-16, 2023

22 May 2023 Meelis Kull Associate Professor at the University of Tartu he field of Machine Learning continues to grow tremendously and has a

Open Machine Learning workshop

significant impact on society. As such, it is important to democratize machine learning, i.e. to make sure that software, datasets, models, and analyses are freely available for easy discovery, verifiability, reproducibility, reuse and meta-analysis.... Read more

Predicting conversational memorability in group interactions: Continual learning approach 22 May 2023

Maria Tsfasman PhD student at TU Delft As Al applications continue to proliferate in our daily lives, the

need for social intelligence in these systems becomes increasingly crucial. To enable long-term performance of social intelligence, AI systems must be aware of important moments, or "hotspots" in user conversations. Till now, conversational hotspots have been mainly... Read more

Mastering Natural Language 22 May 2023

Mariangela Graziano PhD student at Università degli Studi della Campania "L. Vanvitelli" Natural

Language Processing (NLP) is an area of artificial intelligence (AI) that deals with giving computers the ability to understand text and spoken words in the same way that people do. As textual data is now everywhere: documents on

Figure 4. Small part of the gallery of successful Connectivity Fund projects.

General dissemination

We have spread the word about the connectivity fund through various channels:

- An open call submitted to the European Commission Funding and tenders website.
- The TAILOR and AI4EU newsletters posted regular announcements
- The **TAILOR Open Meetings** (online on Zoom) hosted research to speak about their work and experiences in their research visits.
- Connectivity Fund flyers (see Figure 5) were handed out at TAILOR Conferences and TAILOR booths at scientific conferences and other events
- On **Social media** both TAILOR, partner projects, and the researchers themselves tweeted regularly about successful visits. Some examples are shown in Figure 6.

CONNECTIVITY FUND

Connecting all of Europe's top Al labs

The TAILOR network includes many of Europe's top Al labs, and we want to reach out to the many other excellent labs and organizations across Europe to work together and create new breakthroughs in Al.

We especially aim to support young researchers to gain valuable experience and nurture the next generation
of Al researchers.

For a Truly Vibrant Network of Excellence

DEADLINES ANY YEAR: March 15 - July 15 - November 15

Research Visits

We support research visits between 1 and 12 months. We will pick up the bills so that you can focus on doing excellent Al. You must either be from a non-TAILOR lab visiting a TAILOR lab, or vice versa.

Workshops

We support workshops that bring people all across Europe together to solve hard problems in an open atmosphere. Workshops should explicitly bring TAILOR and Non-TAILOR researchers together.

More info? www.tailor-network.eu

Great! Can I apply?

The connectivity fund is open to all European AI researchers. You should be able to demonstrate that you live in Europe and are active in AI through your publication record, or using other proof of involvement in AI research projects. You need a great idea to do excellent AI research, and have an invitation letter from your hosting lab. The focus lies on connecting TAILOR and non-TAILOR labs. Hence, you should be from a non-TAILOR lab and interested in visiting a TAILOR lab. Or, you should be from a TAILOR lab, and be invited by a non-TAILOR lab. Workshops can be hosted by either TAILOR or non-TAILOR labs, but only non-TAILOR attendants can receive funding.

TAILOR is an ICT-48 Network of AI Research Excellence Centers funded by the EU Horizon 2020 research and innovation programme under grant agreement No 952215

The TAILOR project has officially concluded.

We encourage you to stay connected to continue our collaborations and knowledge sharing.

Thank you to everyone who contributed to making TAILOR a success, and let's keep pushing the boundaries of #TrustworthyAl together!

Organisational streamlining

In the last reporting period, we had already taken a list of measures to ensure that the connectivity funding is put to good use, described in Deliverable 10.6. This included a continuous review process so that participants could submit at any time, as well as faster reviewing and coverage of overhead costs to execute the research visits.

Mini-projects with industry

In WP8, through re-allocations of partners' budgets, 3 micro-projects with industry were funded with a maximum of €50,000 each. Since we also want to promote cooperation with non-TAILOR partners and especially start-ups and SMEs, we also made 150.000 € of the Connectivity fund available, in coordination with the Project Officer, for funding opportunities for third party companies in the form of 3 micro-projects. The call for these projects and their evaluation was handled by DFKI in Saarbrücken, according to the rules of the original micro-projects. This is perfectly in line with the goals of the Connectivity Fund, and this action further facilitated technology transfer outside of the TAILOR network.

Applications received

Table 1 lists all the eligible applications in this reporting period, including the project titles, authors, the TAILOR labs and non-TAILOR labs involved, and the amount of requested funding. The institute shown in **bold** is the *hosting lab*, hosting the researcher(s) during their visit or organising a workshop. Most of these are proposals for research visits, others are workshops (highlighted in blue) or micro-projects (highlighted in yellow). Proposals with a female first author are indicated with a pink ID number.

As can be seen from this table, the projects cover a wide range of topics all centred around trustworthy AI. These topics are visualised in Figure 7.

The maximum recommended funding is 15.000 EUR, in order to realise about 100 research visits and workshops on different topics and in different countries. Some visits have a slightly higher budget because of added overhead costs. Some high-impact workshops and summer-schools were allowed a larger budget (with approval from the coordinator) to generate larger impact. For instance, this was done for the ESSAI summer schools, which are also a key TAILOR activity and some participants from the TAILOR network received a free registration. The micro-projects were each allowed a budget of 50.000 EUR, which was agreed with the project officer. While applicants could submit multiple proposals, no organisation was granted more than 60,000 EUR in total, following the FSTP funding rules.

Table 1. Overview of all eligible proposals received during this reporting period. The hosting lab is shown in bold. The non-TAILOR lab is always the recipient of the funding. Workshops are highlighted in blue, micro-projects in yellow. Pink IDs are projects with a female lead author. The final column shows the funding requested.

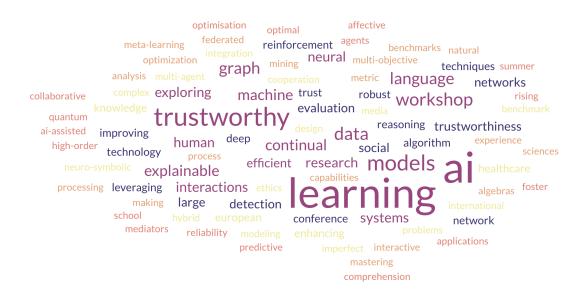

Figure 7. Word cloud of the main keywords of all submitted research and workshop proposals, demonstrating a strong focus on collaboration and trustworthy AI.

Review process and outcome

All applications submitted within the deadline were evaluated for formal eligibility. The eligibility criteria are specified in deliverable D10.1. From the 108 submitted proposals, 8 were desk-rejected since they failed the eligibility test or missed key information. 2 proposals were retracted. All other proposals were reviewed by members of the <u>scientific board</u>, selected based on their topic of expertise. We checked for any conflicts of interest in the assignment. Since proposal 14, on the request of project reviewers, we assigned two reviewers per proposal. Every decision was made based on independent reviews based on a clear set of predefined evaluation criteria.

Gender balance

Ignoring desk rejects and retracted proposals, 19 proposals came from female lead authors (19.4%). All of these were accepted, but two were cancelled after acceptance due to personal reasons, hence finally 89.5% success rate. The remainder had male first authors, with a success rate of 76% (5 were cancelled and 4 rejected).

Scientific board

The scientific board consisted of these experts (23% are female), which played a vital role in selecting promising proposals and helping young researchers gain valuable experience:

- Mitra Baratchi (Leiden University, Netherlands)
- Peter Flach (Bristol University, UK)
- Jose Hernandez-Orallo (Universitat Politècnica de València, Spain)
- Andrea Passerini (Trento University, Italy)
- Joaquin Vanschoren (Eindhoven University of Technology, Netherlands)
- Eva Onaindia (Universitat Politècnica de València)
- Silvia Tulli (Instituto Superior Técnico)
- Jérôme Euzenat (INRIA & University Grenoble Alpes)
- Raul Santos-Rodriguez (University of Bristol)
- Agnieszka Ławrynowicz (Poznan University of Technology)
- Giovanni Casini (National Research Council of Italy)
- Hector Geffner (Universitat Pompeu Fabra, Spain)
- Catholijn Jonker (Delft University, Netherlands)
- Marie-Christine Rousset (Laboratoire d'Informatique de Grenoble, France)
- André Meyer-Vitali (DFKI)
- Francisco Chicano (University of Malaga)
- Isabel Neto (University of Lisbon)
- Hossein Rahmani (Lancaster University)
- Miguel Couceiro (University of Lorraine, CNRS, LORIA)
- Neil Yorke-Smith (Delft University of Technology)
- Saso Džeroski (Jozef Stefan Institute, Slovenia)

¹ On a few occasions, it was not possible to receive two reviews per proposal on time due to high workloads for the scientific board experts.

- Marco Gori (University of Siena, Italy)
- Gerhard Lakemeyer (RWTH Aachen University, Germany)
- Carles Sierra (Artificial Intelligence Research Institute (IIIA-CSIC), Spain)
- Wico Mulder (TNO)
- Andreas Herzig (IRIT-CNS)
- Kim Baraka (VU Amsterdam)
- Manolis Koubarakis (National and Kapodistrian University of Athens)
- Nikolaos Matragkas (CEA)
- Fabrizio Riguzzi (CINI)

Evaluation criteria

All proposals were evaluated according to 5 criteria (Al excellence, scientific track record of the candidate, scientific step-up, the suitability of the host, and appropriateness of the activity duration). The final score is a weighted average of all scores, using the weighting described in deliverable D10.1. As per the Connectivity Fund rules, proposals must achieve a minimum of 70% of the maximal score to receive funding.

Scores per criteria are on a scale from 0-10:

- **0-1** Application fails to address the criterion or cannot be assessed due to missing or incomplete information
- 2-3 Poor criterion is inadequately addressed or there are serious inherent weaknesses
- 4-5 Fair application broadly addresses the criterion, but there are significant weaknesses
- 6-7 Good application addresses the criterion well, but a number of shortcomings are present
- **8-9 Very good** application addresses the criterion very well, but a small number of shortcomings are present
- **10 Excellent** application successfully addresses all relevant aspects of the criterion. Any shortcomings are minor.

Proposal 104-107 where for microprojects, which were reviewed independently by DFKI according to the evaluation criteria described in Deliverable 8.2. Of all these, one was canceled and 3 accepted. The final results of the evaluation are summarised in Table 2.

Table 2. Overview of TAILOR Connectivity fund applications and their evaluation. Each cell shows the evaluation results by two independent reviewers. Hence, '7,9' means that the first reviewer rated the proposal 7/10 and the second reviewer rated it 9/10.

Granted projects

The Connectivity Fund awarded a total of 87 grants for research visits and workshops all over Europe. Below is an overview of most of the grantees with their project titles, project ID, and a very short summary of their work. Click the links to read more about their projects.

Trustworthy Probabilistic Machine Learning Models (#45)

Stefano Teso. Senior Assistant Professor at CIMeC and DISI, University of Trento. There is an increasing need of Artificial Intelligence (AI) and Machine Learning (ML) models that can reliably output predictions matching our expectations. Models learned from data should comply with specifications of desirable behaviour supplied or elicited from humans and avoid overconfidence.

Leveraging Uncertainty for Improved Model Performance (#90)

Luuk de Jong. Master student at Universiteit Leiden. This project investigates the integration of a reject option in machine learning models to enhance reliability and explainability. By rejecting uncertain predictions, we can mitigate risks associated with low-confidence decisions, meaning the model will be more reliable.

TEC4CPC – Towards a Trustworthy and Efficient Companion for Car Part Catalogs (#106) Patrick Lang. B.Sc. at N4. N4, a leading provider of procurement platforms in the automotive sector, is facing the challenge of making its catalogues for car parts (N4Parts) more user-friendly. These catalogues are used by customers both to purchase parts and to obtain information, such as installation instructions and maintenance intervals.

Reconciling AI explanations with human expectations towards trustworthy AI (#102) **Jeff Clark.** Research Fellow at the University of Bristol. With the widespread deployment of AI systems, it becomes increasingly important that users are equipped to scrutinise these models and their outputs. This is particularly true for applications in high-stakes domains such as healthcare.

The European ecosystem of Large Language Models (#101)

Dan Saattrup Nielsen PhD student at Alexandra Instituttet. Presentation on the benchmarking of LLMs, with a specific application to the Northern European languages. The challenges of evaluating generative language models, the different ways in which this can be done, and the current status within the

Northern European language will be presented.

Alzheimer's Diagnosis: Multimodal Explainable AI for Early Detection and Personalized Care (#107) Nadeem Qazi. Senior Lecturer at University of East London, UK. Alzheimer's disease (AD) is becoming more common, emphasising the need for early detection and prediction to improve patient outcomes. Current diagnostic methods are often too late, missing opportunities for early intervention. We develop explainable AI models to identify early signs and risk factors of AD.

Exploring Prosocial Dynamics in Child-Robot Interactions: Adaptation, Measurement, and Trust (#95) Ana Isabel Caniço Neto. Assistant Researcher at the University of Lisbon. Social robots are increasingly finding application in diverse settings, including our homes and schools, thus exposing children to interactions with multiple robots individually or in groups. Understanding how to design robots that can effectively interact and cooperate with children in these hybrid groups is crucial for ensuring satisfactory and enduring interactions.

Types of Contamination in Al Evaluation: Reasoning and Triangulation (#103) **Behzad Mehrbakhsh** PhD student at Universitat Politècnica de València. A comprehensive and accurate evaluation of Al systems is indispensable for advancing the field and fostering a trustworthy Al ecosystem. Al evaluation results have a significant impact, ultimately determining which products or services are deemed effective, safe and reliable.

CLAIRE | Rising Research Network: AI Research and Mental Well-Being Workshop 2nd edition (#88) Marie Anastacio PhD candidate at Leiden University, RWTH Aachen. After the successful workshop in collaboration with the TAILOR- ESSAI Summer School, we propose a 2nd edition at ESSAI2024. The event will focus on fostering a community of young AI researchers in Europe, supporting AI researchers and promoting mental well-being for Ph.Ds.

Machine Learning Modalities for Materials Science (#50)

Milica Todorovic Associate professor at University of Turku. In the past decade, Al algorithms have demonstrated a tremendous potential and impact in the discovery of new materials. The objective of the workshop and school "Machine Learning Modalities for Materials Science" (MLM4MS 2024) is to bring together

Evaluating the Trustworthiness of Human-like Robotic Motion (#86)

Filipa Correia Assistant Researcher at Interactive Technologies Institute,
University of Lisbon. The research project will explore the trustworthiness of an
embodied AI, such as a social robot. Specifically, it will investigate whether the
performance of humanlike motions of a non-humanoid robot enhances the
perceived trustworthiness of that robot.

computer science, materials science, physics and chemistry communities.

Explanations and Reasoning: Proofs and Models of Intuitionistic Modal Logics (#98) **Philippe Balbiani** CNRS researcher at Toulouse Institute of Computer Science Research (Toulouse, France). Rooted in Intuitionistic and Constructive Reasoning, Intermediate Logics have found important applications through the Curry-Howard correspondence. Nowadays, there is an Intuitionistic Modal Logics renaissance in Computer Science and Artificial Intelligence.

Neuro-symbolic integration for graph data (#70)

Manfred Jaeger Associate Professor at Aalborg University. Learning and reasoning with graph and network data has developed as an area of increase.

reasoning with graph and network data has developed as an area of increasing importance over recent years. Social networks, knowledge graphs, sensor and traffic networks are only some of the examples where graph-structured data arises in important applications.

Improving Cross-Lingual Retrieval of Previously Fact-Checked Claims (#89) Róbert Móro Researcher at Kempelen Institute of Intelligent Technologies. To mitigate disinformation with AI in a trustworthy way, it should prioritise human agency and control, transparency, and accountability including the means for redress. This can be achieved by using AI to support rather than to replace media professionals, such as fact-checkers.

Al/TP Methods for maximizing generality and tractability of algebras (#100)

Gonçalo Gomes Araújo PhD at Nova FCT. We value a mathematical theory for its generality and its tractability. The goal of this project is to use Artificial Intelligence Theorem Proving (AITP) tools and AI techniques to devise new mathematical theories, maximising generality and tractability.

Enhancing Reliability and Trustworthiness in IoT Applications through Deep Learning-Based Data Imputation Techniques (#92)

Hakob Grigoryan PhD at NVISION. With the evolution of intelligent sensing devices and the Internet of Things (IoT), a vast amount of data is generated from various sources, including sensors, cameras, and network infrastructures. The goal of my research visit to the University of Athens is to investigate the effectiveness of intelligent data-driven methodologies for the imputation task of IoT data streams.

Exploring Intrusion Detection Knowledge Transfer Between Network

Environments (#83) Patrik Goldschmidt PhD candidate at Kempelen Institute of Intelligent Technologies. With the rise of the Internet, the number of cybersecurity incidents has grown immensely. As a response, the research area of Intrusion Detection Systems (IDSs), has gained significant attention. Our research focuses on Network IDSs, which detect attacks on the network level.

Enhancing Trustworthiness in Healthcare Large Language Models (#74)

Muhammad Waseem Postdoctoral Researcher at Faculty of Information
Technology, University of Jyväskylä, Finland. Large Language Models (LLMs) are
advanced AI tools capable of understanding and generating human-like text,
advancing various sectors. This project aims to enhance healthcare services using
LLMs, focusing on improving their trustworthiness for clinical applications.

Continual Self-Supervised Learning (#87)

Giacomo Cignoni Research Fellow at the University of Pisa. Learning continually from non-stationary data streams is a challenging research topic of growing popularity in the last few years. Being able to learn, adapt and generalise continually, in an efficient way appears to be fundamental for a more sustainable development of Artificial Intelligent systems.

Tractable and Explainable Probabilistic AI (#91)

Lennert De Smet PhD at KU Leuven. Transparency and technical robustness are two fundamental requirements for AI systems following the European Union AI Act, especially in higher-risk domains. Transparency is intricately related to the notion of explainability, allowing an AI system to accurately describe the reasoning behind its predictions.

Trustworthy, Ethical and Beneficial-to-All Multiagent Systems Solutions for Social Ridesharing and the Hospitality Industry (#56) **Georgios Chalkiadakis** Professor at Technical University of Crete. Current mobility-as-a-service platforms have departed from the objectives of the sharing economy-inspired social ridesharing paradigm: they view drivers as taxi workers; focus on profit maximisation rather than fair travel costs' allocation; and disregard essential private preferences of users.

Translating between AI Evaluation and Job Tasks in the human workplace for trustworthy and reliable AI deployment (#85) Marko Tesic Post-doc at LCFI, University of Cambridge, UK. Recent advancements in AI have rekindled concerns about the potential automation of certain roles within the human workforce. We aim to better understand which roles are susceptible to automation and to ensure the trustworthy and reliable deployment of AI.

Evaluation of cognitive capabilities for LLMs (#80)

Lorenzo Pacchiardi Post-doc at University of Cambridge. Artificial Intelligence (AI) systems (such as reinforcement-learning agents and Large Language Models, or LLMs) are typically evaluated by testing them on a benchmark and reporting an aggregated score. As benchmarks are constituted of instances demanding various capability levels to be completed, the aggregated score is uninformative of the AI's cognitive capabilities.

D10.7 Connectivity Fund

Large Language Models for Media and Democracy: Wrecking or Saving Society? (#77) Davide Ceolin, Piek Vossen, Ilia Markov, Catholijn Jonker, and Pradeep Murukannaiah. Foundational models have significantly advanced the possibilities regarding the understanding, analysis, and generation of human language. With this workshop, we intend to map the salient technical and societal issues that emerged and to discuss recent developments to address them.

Grounded World Models for Higher Layers of Meaning (#67)

Stefano de Giorgis Post-doc researcher at Institute for Cognitive Sciences and Technologies – National Research Council (ISTC-CNR), Italy. The project involves knowledge representation techniques, neuro-symbolic AI, and cognitive semantics. The notion of "Grounded Wold Models" is here defined as Cognitive

Multi-agent scheduling in a human-robot collaborative warehouse (#78)

Bram Renting PhD at Leiden University, Delft University of Technology. In cooperative multi-agent environments, agents can be interdependent in completing tasks. We consider environments where agents schedule future interactions with others they depend on to perform the task. Our project focuses on human-robot warehouses where humans pick products from shelves and robots transport goods.

Evolution of Theory of Mind (#69)

Representations of (a certain portion of) the world.

Harmen de Weerd Assistant Professor at University of Groningen In social interactions, humans often make use of their "theory of mind", which refers to their ability to reason about unobservable mental content of others. This project revolves around the question of why such a cognitively demanding ability may have evolved for humans, but not for other species.

Al Safety Working group - European kickoff workshop (#71)

Xavier Fresquet Deputy Director, PhD at Sorbonne Université. Al systems offer the potential for substantial benefits to society but they are not without risks, such as toxicity, misinformation, and bias. As with other complex technologies, society needs industry-standard safety testing to realise the benefits while minimising the risks.

Building trust in administrative automation through the use of LLMs in the public sector of Sweden (#72) Niclas Willem Fock CEO Santa Anna IT Research Insititute, Sweden (Linköping University). There are today a number of use cases for language models that have been identified as possible to implement. The purpose of the Workshop is to demonstrate completed and ongoing project examples to effectively illustrate what can be realistic goals, or possible projects to start as soon as the will and resources are available.

Eindhoven - Leuven - Aachen Al Workshop Series on Secure, Reliable and Trustworthy Al (#73) Alexa Kodde Project Manager at CLAIRE. The Al Workshop Series on Secure, Reliable and Trustworthy Al, hosted by TU Eindhoven, KU Leuven, and RWTH Aachen University, is to strengthen regional, regional, cross-border, and European research in transparent and reliable Al, and explicitly align with TAILOR, focusing on Trustworthy Al.

Europe's Moonshot Ambition in Al: Vision & Implementation (#65)

Alexa Kodde Project Manager at CLAIRE. Al is the primary driver of scientific discoveries, industrial engineering, energy production, logistics, the creative economy, education, and public services. The vision for "Al Made in Europe" is more important than ever. But are we sure the vision has not become "Al Made Elsewhere"?

An Adaptive Initial Design for Bayesian Optimization (#64)

Carolin Benjamins PhD at Leibniz University Hannover. Our goal is to progress on Dynamic Algorithm Configuration (DAC) for Bayesian Optimization (BO). BO is a widely-used and sample-efficient framework for optimising black-box problems, which are often expensive to evaluate. Dynamically configuring BO enables to adapt to the optimization progress and to any problem landscape.

<u>Leveraging Social Agents as Mediators to Foster Trust and Comprehension of Affective Engagement with Digital Content (#63)</u>

Sergio Muñoz Assistant Professor at Universidad Politécnica de Madrid The vast and ever-expanding digital landscape presents significant challenges for users striving to navigate and discern accurate information. This challenge is compounded by the dynamic nature of the Internet, characterised by attention-seeking strategies intended to exploit users' unconscious emotional responses. This affects the credibility of information...

Improving Multi-Task Parameter-Efficient Fine-Tuning Methods (#62)

Róbert Belanec PhD at Kempelen Institute of Intelligent Technologies The trustworthiness of the generative AI models is an important topic, especially with the increase in popularity of generative large language models. In recent years, the transformer architecture has become popular in the field of natural language processing. However, the increase in parameters is reducing the...

Explainable Semi-Supervised Fuzzy C-Means (#49)

Kamil Kmita Research Assistant at Systems Research Institute, Polish Academy of Sciences Semi-Supervised Fuzzy C-Means (SSFCMeans) model adapts an unsupervised fuzzy clustering algorithm to handle partial supervision in the form of categorical labels. One of the key challenges is to appropriately handle the impact of partial supervision (IPS) on the outcomes of the model.

The First Workshop on Hybrid Human-Machine Learning and Decision Making (#44) **Andrea Passerini** Associate professor at University of Trento. In the past, machine learning and decision-making have been treated as independent research areas. However, with the increasing emphasis on human-centered AI, there has been a growing interest in combining these two areas. We explore approaches that complement human decision-making rather than replace it.

International Conference "AI for People: Democratizing AI" (#52)

Al for People International nonprofit organisation. The International Conference "Al for People" was born out of the idea of shaping Artificial Intelligence technology around human and societal needs. While Artificial Intelligence (AI) can be a beneficial tool, its development and its deployment impact society and the environment in ways that need to be thoroughly addressed.

Robust and safe reinforcement learning against uncertainties in human feedback (#43) **Taku Yamagata** Senior Research Associate at the University of Bristol Abstract One of the promising approaches to improve the robustness and safety of reinforcement learning (RL) is collecting human feedback and, that way, incorporating prior knowledge of the target environment. However, human feedback can be inconsistent and infrequent.

Holistic Evaluation of Al-assisted Biomedicine: A Case study on Interactive Cell Segmentation (#47) Wout Schellaert PhD student at Universitat Politècnica de València. Abstract Rapid advances in artificial intelligence have resulted in a correspondingly growing prominence of Al-based tools in day to day biomedicine workflows. As a high-risk domain with impact on human health, it is of vital importance that any Al systems in use are reliable, safe, and...

1st ContinualAI Unconference (#40)

Vincenzo Lo Monaco Assistant Professor, ContinualAl President. Organised by the non-profit ContinualAl, the conference will speed up the long desired inclusive and sustainable progress of our community with an open-access, multi-timezone, 24-hour-long event that brings together ideas at the intersection of machine learning, computational neuroscience, robotics and more!

CLAIRE | Rising Research Network: AI Research and Mental Well-Being Workshop (#39) Nicolò Brandizzi PhD student at Sapienza University of Rome. The CLAIRE Rising Researcher Network (R2Net) aims to create a shared space for Ph.D. students in AI across Europe, offering support, networking opportunities, and resources. This one-day event during the ESSAI Summer School will feature a panel discussion on Ph.D. life, an ESA presentation, and a networking session.

Fostering Appropriate Trust in Predictive Policing Al Systems (#32)

Siddharth Mehrotra PhD student at TU Delft. The use of Al in law enforcement, particularly in predictive policing, raises concerns about bias, discrimination, and infringement of civil liberties. In this proposal, we aim to investigate how explanations generated by predictive policing systems and trust calibration cues can be used to establish appropriate trust in these systems.

Meta-learning for Continual Learning (#35)

Anna Vettoruzzo PhD student at Halmstad University. Continual learning (CL) refers to the ability to continually learn by accommodating new knowledge while retaining previously learned experiences. While this concept is inherent in the human learning ability, current machine learning-based methods struggle with this as they are highly prone to forget past experiences.

Deep reinforcement learning for predictive monitoring under LTLf constraints (#27) **Efrén Rama Maneiro** PhD student at the University of Santiago de Compostela. Predictive monitoring is a subfield of process mining that focuses on predicting how a process will unfold. Deep learning techniques have become popular in this field due to their enhanced performance. This research proposal aims to define a novel predictive monitoring approach.

Data-Centric AutoML and Benchmarks with Optimal Transport (#37)

Prabhant Singh Research Engineer at TU Eindhoven. Automated machine learning (AutoML) aims to make easier and more accessible use of machine learning algorithms for researchers with varying levels of expertise. Our project aims to develop methods and systems that utilise Optimal Transport-based measures to calculate dataset similarity in these scenarios.

Multi-Objective Rating Systems (#29)

Paolo Turrini Associate Professor at the Department of Computer Science, University of Warwick. This project studies rating systems with multiple objectives. In particular, it looks beyond classical Pareto efficiency, studying allocations that satisfy fairness, diversity, and reliability.

Optimal training of a structured ensemble of Binarized Neural Networks with Mixed-Integer Linear Programming techniques (#33)

Simone Milanesi, Ambrogio Maria Bernardelli PhD students at the CompOpt Lab (University of Pavia). Binarized Neural Networks (BNNs) are receiving increasing attention due to their lightweight architecture and ability to run on low-power devices. We propose the BeMi ensemble, a structured architecture of BNNs available.

Open Machine Learning workshop (#30)

Meelis Kull Associate Professor at the University of Tartu. The field of Machine Learning continues to grow tremendously and has a significant impact on society. As such, it is important to democratize machine learning, i.e. to make sure that software, datasets, models, and analyses are freely available for easy discovery, verifiability, reproducibility, reuse and meta-analysis.

Predicting conversational memorability in group interactions: Continual learning approach (#34) **Maria Tsfasman** PhD student at TU Delft. As Al applications continue to proliferate in our daily lives, the need for social intelligence in these systems becomes increasingly crucial. To enable long-term performance of social intelligence, Al systems must be aware of important moments, or "hotspots" in user conversations.

Mastering Natural Language Processing methodologies and technologies (#28) Mariangela Graziano PhD student at Università degli Studi della Campania "L. Vanvitelli". Natural Language Processing (NLP) is an area of artificial intelligence (AI) that deals with giving computers the ability to understand text and spoken words in the same way that people do. The major challenge is to build intelligent and autonomous systems (cognitive computing), maybe in the body of a robot.

Mastering Natural Language Processing and Process Mining methodologies and technologies (#28) Luigi Colucci Cante PhD student at Università degli Studi della Campania "Luigi Vanvitelli". A very ambitious process has been going on to digitalize the entire public administration system. I want to investigate Business Process Management based on event logs obtained from public administrations' IT systems, using specific Process Mining techniques.

Towards Prototype-Based Explainable Machine Learning for Flood Detection (#25) Ivica Obadic Chair of Data Science in Earth Observation at the Technical University of Munich. High-resolution satellite data has shown to be a valuable resource in tackling pressing issues related to climate change and urbanisation such as flood detection. We aim to develop an explainable model that combines prototype-based explainability with graph neural networks.

Sample Selection with Group Metric for Experience Replay in Continual Learning (#23) Andrii Krutsylo PhD student at the Institute of Computer Science of the Polish Academy of Sciences. The study aims to reduce the decline in performance of a model trained incrementally on non-i.i.d. data, using replay-based strategies to retain previous task knowledge. To address limitations in existing variations, a new metric will be found to choose the optimal replay batch from the memory buffer.

Large Scale Combinatorial Graybox Optimization (#22)

Lorenzo Canonne PhD student at Inria. The field of grey box optimization has led to the design of new operators capable of using the structural information of problems; these operators are now the basis of powerful meta-heuristics. For large-scale NK landscapes, many operators have been proposed and iterated local search combined with grey box crossovers is now the state of the art.

Making big benchmarks more trustworthy: Identifying the capabilities and limitations of language models by improving the BIG-Bench benchmark (#20) **Ryan Burnell** Postdoctoral Research Fellow at Leverhulme Centre for the Future of Intelligence, University of Cambridge, UK. Al systems are becoming an integral part of every aspect of modern life. To ensure public trust in these systems, we need tools that can be used to evaluate their capabilities and weaknesses.

<u>Learning Neural Algebras</u> (#19)

Pedro Zuidberg Dos Martires Postdoctoral Researcher at Örebro University (Sweden). Algebra provides a formalism to study sets and how the elements of these sets relate to each other by defining relations between set elements. Abstract algebraic structures are abundantly present in artificial intelligence. For instance, Boolean algebra constitutes the bedrock of symbolic AI

Learning trustworthy models from positive and unlabelled data (#18)

Pawel Teisseyre Assistant Professor at the Polish Academy of Sciences The goal of the research stay is to explore learning classification models using positive-unlabelled (PU) data. In PU learning, it is assumed that only some observations in training data are assigned label, which is positive, whereas the remaining observations are unlabelled and can be either...

Imagining the landscape after the AI Act (#13)

Francesca Naretto PhD Student In April 2021, the EU Parliament published a proposal, the AI Act (AIA), for regulating the use of AI systems and services in the Union market. However, the effects of EU digital regulations usually transcend its confines. An example of what has been named the "Brussel effect" – the high impact…

A Modular Framework for Hybrid Participatory Systems (#15)

Enrico Liscio TU Delft PhD student Participatory systems aim to elicit citizens' stances on societal discussions to inform policy making. In particular, human values are a crucial component of citizens' stances, since they are the drivers of our opinions and behaviours. Al can enable mass participation and process large quantities of citizens' input.

<u>Trustworthy AI for human behavior prediction by autonomous vehicles</u> (#14)

Julian F. Schumann TU Delft PhD student. For humans to trust autonomous vehicles, they need to have confidence in the vehicles' ability to reliably resolve space-sharing conflicts with other traffic participants in a safe manner – such as in the case of crossing or merging paths. Planning safe and efficient interactions for autonomous vehicles.

Graph Gaussian Processes for Interactive Robot Task Learning (#17)

Giovanni Franzese TU Delft PhD candidate. The adaptability of robot manipulators to many different tasks is currently constrained by systematic hard coding of each specific task. Machine learning methods like Learning from Demonstrations (LfD) and Reinforcement Learning (RL) have shown promising results in having fast reprogramming of the task using human demonstrations.

Multi-Objective Statistically Robust Algorithm Ranking (#16)

Jeroen G. Rook University of Twente PhD candidate Comparing algorithms is a non-trivial task. Often, a set of representative problem instances are used to compare algorithms. However, these problem instances introduce biases in the comparison outcomes, which is often not taken into account. The confidence of the comparison can be strengthened by using statistical... Read more:

Multi-Objective Statistically Robust Algorithm Ranking

Deep fake videos detection through Explainable AI (#12)

Nadeem Qazi University of East London. Aiming towards combating the challenges faced by fake video detection, the prime objective of this research is to develop a proactive, advanced explainable, human collaborated Al-based online disinformation detecting tool for securing a trustworthy social media environment.

Modeling others for cooperation under imperfect information (#11)

Nieves Montes PhD Student at Artificial Intelligence Research Institute (IIIA-CSIC). This research visit will focus on models for empathetic software agents. This means embedding autonomous agents with the ability to model their peers and understand the reasons behind their behaviour. This work is to enhance the performance of agents in cooperative tasks.

Logic-based multi-agent reinforcement learning (#10)

Brian Logan Associate Professor at Utrecht University. Many activities that are easy for humans, such as walking together with other humans, are hard to program as a set of rules for Artificial Intelligence (AI) robots. The project will investigate techniques to speed up learning, and guarantee that the learnt behaviour satisfies pre-defined properties.

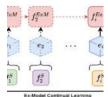

Conformal Inference for multivariate, complex, and heterogeneous data (#7) Marcos Matabuena University of Santiago de Compostela. In this project, in collaboration with Gábor Lugosi (UPF), we propose new uncertainty

quantification methods based on the design of new Conformal Inference strategies for complex data that arise in modern personalised medicine applications.

Neuro-symbolic integration for graph data (#6)

Manfred Jaeger Associated Professor at Aalborg University. From Social networks to bibliographic databases: many important real-world phenomena consist of networks of connected entities. The mathematical model of such networks is that of a graph, which in its basic form just consists of a collection of nodes that are connected by edges.

Private Continual Learning from a Stream of Pretrained Models (#8)

Antonio Carta Post-doc at Pisa University. Learning continually from non-stationary data streams is a challenging research topic of growing popularity in the last few years. Being able to learn, adapt and generalise continually, in an efficient, effective and scalable way appears to be fundamental for a more sustainable development of Artificial Intelligent systems.

Matheuristic Techniques for Timetabling Problems (#5)

Roberto Maria Rosati PhD Student in Information Engineering at University of Udine. Recently, matheuristics has emerged as a promising research branch in combinatorial optimization. Thanks to this collaboration supported by TAILOR connectivity fund, we will design and apply novel matheuristic techniques to a variety of timetabling problems that are under investigation.

1st International Joint Conference on Learning & Reasoning (#2)

Nikos Katzouris National Center for Scientific Research "Demokritos". The rapid progress in machine learning has been the primary reason for a fresh look at the transformative potential of AI as a whole during the past decade. The 1st International Joint Conference on Learning & Reasoning (IJCLR 2021) brought together four international conferences and workshops, addressing various aspects of integrating machine learning and machine reasoning.

Trustworthy and sample efficient computer vision (#1)

Mohammadreza Amirian Research assistant, Zurich University of Applied Sciences (ZHAW). Transformers are being adapted for computer vision and image classification tasks. We aim to extend the concept of rotation equivariance to affine-transformation equivariance to improve the trustworthiness of the decisions and robustness of the vision transformer models.

Conflict Resolution Algorithm for the Ethics of AI (#3)

Réka Markovich Post-doctoral Researcher at Luxemburg University. The ethical rules for the so-called moral behaviour of Al tools are a major concern, and each Al tool has multiple stakeholders with possibly different moral backgrounds and expectations. How should we decide whose moral expectations these tools should meet?

Retrospective

Problems encountered and solutions

This is primarily a mobility fund, and COVID-19 meant that almost no visits were possible during the first 1,5 years of the Connectivity Fund. The extension of TAILOR to 4 years helped a lot to still realise many visits. We originally envisioned to fund 100 visits, and realised 87. We actually accepted 94, but 7 were cancelled unilaterally after acceptance, most of them towards the end of the TAILOR project, often because the host university couldn't complete the paperwork on time to start the research visit in a timely fashion, or for personal reasons.

The number of proposals was a lot of administrative work. We resolved this by devoting extra staff to this (but more than was initially planned), and by extensively streamlining the process via automated forms.

There were many small problems which are linked to the strict requirements of FSTP funding and a lot of back and forth with 80+ different university and SME administrations. In one case it took 6 months to get the agreement signed. Allowing 25% overhead to be charged for managing the received funds simplified things a lot (otherwise some beneficiaries refused to collaborate). The main 'solution' here was to iterate many times over the subgrant agreement to get the language right and the edge cases resolved.

What has been learned

The connectivity fund proved to be an extremely useful instrument and a major benefit for European Al researchers. It's also extremely effective, resulting in new collaborations and outcomes at low cost, resulting in many new ideas and outcomes that otherwise would not have happened.

Administration is a major headache since we had to deal with so many different labs. It would make a lot of sense if this could be managed by a single third party entity rather than with 80+ other administrations.

Impact

The Connectivity fund is a key mechanism to foster collaboration and allows researchers all over Europe to work on the core research problems addressed by the TAILOR network. It also allows TAILOR to open up to a wider section of the AI community. To measure its impact, for all proposals since 2022, we ask all participants to send a structured scientific report containing:

- A summary of the research objectives
- Technical approach, findings, and future work
- A self-assessment of the impact of the research visit on AI excellence and their own careers, as well as the suitability of the host and the visit length.
- A list of publications and other outcomes of the visit.

These reports (for the completed visits) are attached with this deliverable. The amount of outputs is too extensive to list in this deliverable, but for every project the corresponding scientific report can be found. In most cases, the granted projects led to very useful research visits and workshops with useful outcomes. Most of them resulted in new publications and plans for further collaboration. A very positive experience was reported for almost all participants. It allowed the TAILOR network to interact with a much broader range of AI labs than those in the original network, and made TAILOR much more visible and impactful. Connectivity Fund recipients were also very active in TAILOR webinars, meetings and conferences.
